If a TCP/IP service provider on Windows XP with SP1 and on Windows Server 2003 supports IPv4 and IPv6 addressing, it must create two separate sockets and listen separately on these sockets: Once for IPv4. Once for the IPv6 address family. Windows Vista and later offer the ability to create a single IPv6 socket which can handle both IPv6 and IPv4 traffic. For example, a TCP listening socket for IPv6 is created, put into dual stack mode, and bound to port 5001. This dual-stack socket can ...

Datagram sockets are sometimes called "connectionless sockets". (Though they can be connect()'d if you really want. See connect(), below.) Stream sockets are reliable two-way connected communication streams. If you output two items into the socket in the order "1, 2", they will arrive in the order "1, 2" at the opposite end.

### Beej's Guide to Network Programming

When a client connects, it returns a new socket object representing the connection and a tuple holding the address of the client. The tuple will contain (host, port) for IPv4 connections or (host, port, flowinfo, scopeid) for IPv6. See Socket Address Families in the reference section for details on the tuple values.
